

Saw Palmetto: An Essential Male Breast Enlargement Herb

Testosterone can sabotage male to female breast enlargement. Discover how saw palmetto, nature's most powerful anti-androgen, can help stimulate male breast growth without the risks of surgery or synthetic hormones.

Male to female breast enlargement is triggered by a precise blend of hormones, including estrogen, progesterone, prolactin and growth hormone. But there is one male hormone that can stop breast growth in its tracks: testosterone.

Fortunately, there is a solution: saw palmetto. Saw palmetto berries, found on saw palmetto trees in Florida, are a traditional Native American herb. Saw palmetto is most commonly used by males to treat the symptoms of an enlarged prostate, but it is also effective for male to female breast enlargement.

Native American women were the first to discover saw palmetto's breast enlarging abilities. Saw palmetto works by preventing testosterone from converting to an even more potent form known as dihydrotestosterone (DHT). DHT causes hair loss and prostate problems in males and is sure to sabotage breast enlargement efforts by inhibiting estrogen – the hormone most responsible for male to female breast enlargement.

You can even find a reference to saw palmetto in the "King's American Dispensatory," which was the standard text used by physicians over one hundred years ago. It states, "Continued use of saw palmetto is said to slowly and surely cause the mammary glands to increase."

Saw palmetto is an essential male breast enlargement herb. It is nature's most effective anti-androgen and can help any male to female crossdresser or transsexual develop feminine breasts without the risks of surgery or synthetic hormones.

Saw palmetto is available in any health food store. To get started, simply take one capsule three times daily and increase as needed, making sure not to exceed the manufacturer's guidelines.

It's a safe and natural way to stimulate male to female breast enlargement!
