Element symbols and names, symbols, and spellings are those recommended by IUPAC (<http://www.iupac.org>). After controversy, the names of elements 101-109 are now confirmed (Pure & Appl. Chem., 1997, 69, 2471-2473). Names have yet to be proposed for the elements 110-112, 114, 116, and 118, those used here are IUPAC's temporary systematic names (Pure & Appl. Chem., 1979, 51, 381-384). In the USA and some other countries, the spellings aluminum and cesium are normal while in the UK and elsewhere the usual spelling is sulphur. Atomic weights (mean relative masses): Apart from the heaviest elements, these are IUPAC 1997 values (Pure & Appl. Chem., 1999, 71, 1593-1607). Elements for which values are given in brackets have no stable nuclides and are represented by 5-figure values for the longest-lived isotope. The elements thorium, protactinium, and uranium have characteristic terrestrial abundances and these are the values quoted. The last significant figure of each value is considered reliable to ± 1 except where a larger uncertainty is given in parentheses. Periodic table organisation: for a justification of the positions of the elements La, Ac, Lu, and Lr in the WebElements periodic table see W.B. Jensen, "The positions of lanthanum (actinium) and lutetium (lawrencium) in the periodic table", J. Chem. Ed., 1982, 59, 634-636. Group labels: the numeric system (1-18) used here is the current IUPAC convention. For a discussion of this and other common systems see: W.C. Fernelius and W.H. Powell, "Confusion in the periodic table of the elements", J. Chem. Ed., 1982, 59, 504-508. ©2001 Dr Mark J Winter (WebElements Ltd and University of Sheffield). All rights reserved.
